

Chapter 15

Summary of pH Calculations

Find the pH of...

1. Strong Acids & Bases

- Strong acids completely dissociate, so $\text{pH} = -\log[\text{acid}]$
- Strong bases completely dissociate, so $\text{pOH} = -\log[\text{base}]$ then $\text{pH} = 14 - \text{pOH}$

2. Weak Acids & Bases

- Add to H_2O and put into a RICE table.
 - ♦ Weak Acid: $\text{HA}(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{H}_3\text{O}^+(\text{aq}) + \text{A}^-(\text{aq})$
 - ♦ Weak Base: $\text{B}(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{OH}^-(\text{aq}) + \text{BH}^+(\text{aq})$

3. Salt Solution

- Dissociate salt into component ions (the ion may have been left over in an invader problem)
 - ♦ Salt Dissociates: $\text{MA}(\text{s}) \rightarrow \text{M}^+(\text{aq}) + \text{A}^-(\text{aq})$
- Add weak ion to H_2O and put in a RICE table ($K_w = K_a / K_b$ or vice versa)
 - ♦ Anion of Weak Acid: $\text{A}^-(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{HA}(\text{aq}) + \text{OH}^-(\text{aq})$
 - ♦ Cation of Weak Base: $\text{M}^+(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{MOH}(\text{aq}) + \text{H}^+(\text{aq})$
 - Ammonium Ion (& Amines): $\text{NH}_4^+(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{H}_3\text{O}^+(\text{aq}) + \text{NH}_3(\text{aq})$

4. Buffers

Henderson – Hasselbalch Equation

- If given a weak acid and its conjugate base (HA & MA), then use $\text{pH} = \text{p}K_a + \log \frac{[\text{ion}]}{[\text{acid}]}$
- If given a weak base and its conjugate acid (B & BH^+), then use $\text{pOH} = \text{p}K_b + \log \frac{[\text{ion}]}{[\text{base}]}$

5. Invaders – adding something strong to #2, 3, or 4 above and find resulting pH.

- First set up stoichiometry table to determine what is left over (will run out of something).
- Depending on what is left over add to H_2O and use a RICE table or if you have a buffer use Henderson-Hasselbalch.

Titration...

1. General Set Ups (Remember Acids donate H^+ and bases accept H^+)

- Strong Acid + Strong Base (equivalence point is 7)
 - ♦ $\text{H}^+ + \text{OH}^- \rightarrow \text{H}_2\text{O}$
- Strong Acid + Weak Base (equivalence point is <7)
 - ♦ $\text{H}^+ + \text{NH}_3 \rightarrow \text{NH}_4^+$
- Strong Base + Weak Acid (equivalence point is >7)
 - ♦ $\text{OH}^- + \text{HA} \rightarrow \text{H}_2\text{O} + \text{A}^-$

2. Equivalence point

- moles of base = moles of acid
- When figuring out how many milliliters it takes to reach the equivalence point, you need to take into consideration the mole ratio from the balanced equation.

3. Effective Buffer

- equal moles of acid and base so $\text{pH} = \text{p}K_a$

4. ½ Equivalence Point

- find the pH at the ½ equivalence point by dividing the volume of titrant at the equivalence point by 2
- use that volume to find pH at the ½ equivalence point. Then...
 - ♦ for a weak acid: $\text{pH} = \text{p}K_a$
 - ♦ for a weak base: $\text{pOH} = \text{p}K_b$
